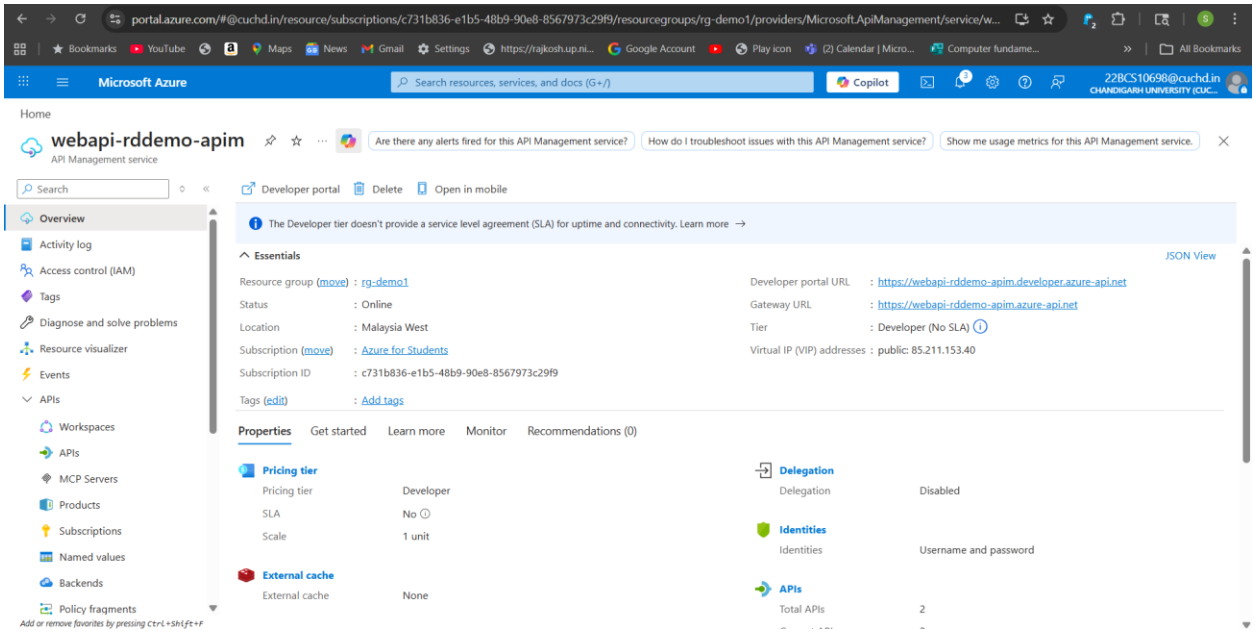
Azure Web API Publish to App Service with APIM

Objective: Create a Web API in Visual Studio, publish it to Azure App Service as a Web App, create Azure API Management (APIM) during publish, and verify APIM features.

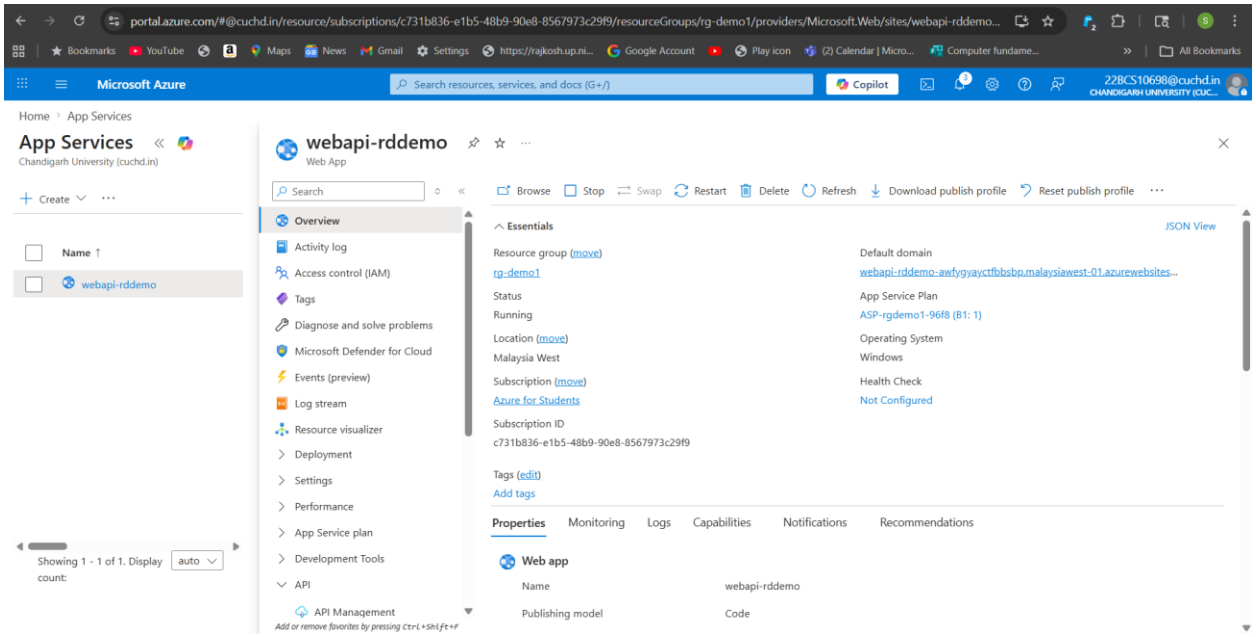
Step 1: Published Web App in Azure App Service

Publish the ASP.NET Web API project from Visual Studio to Azure App Service. During publish, enable creation/integration of Azure API Management.



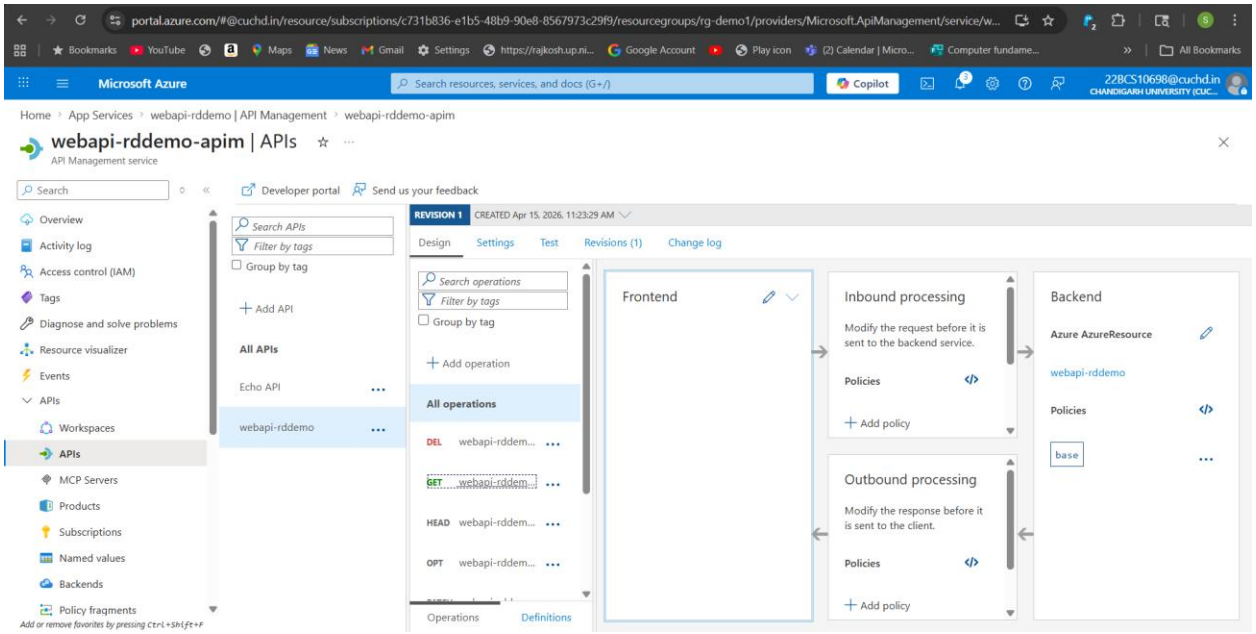
Step 2: Verify Web App (App Service) in Azure Portal

Confirm the Web App is running in Azure App Service and note the default domain.



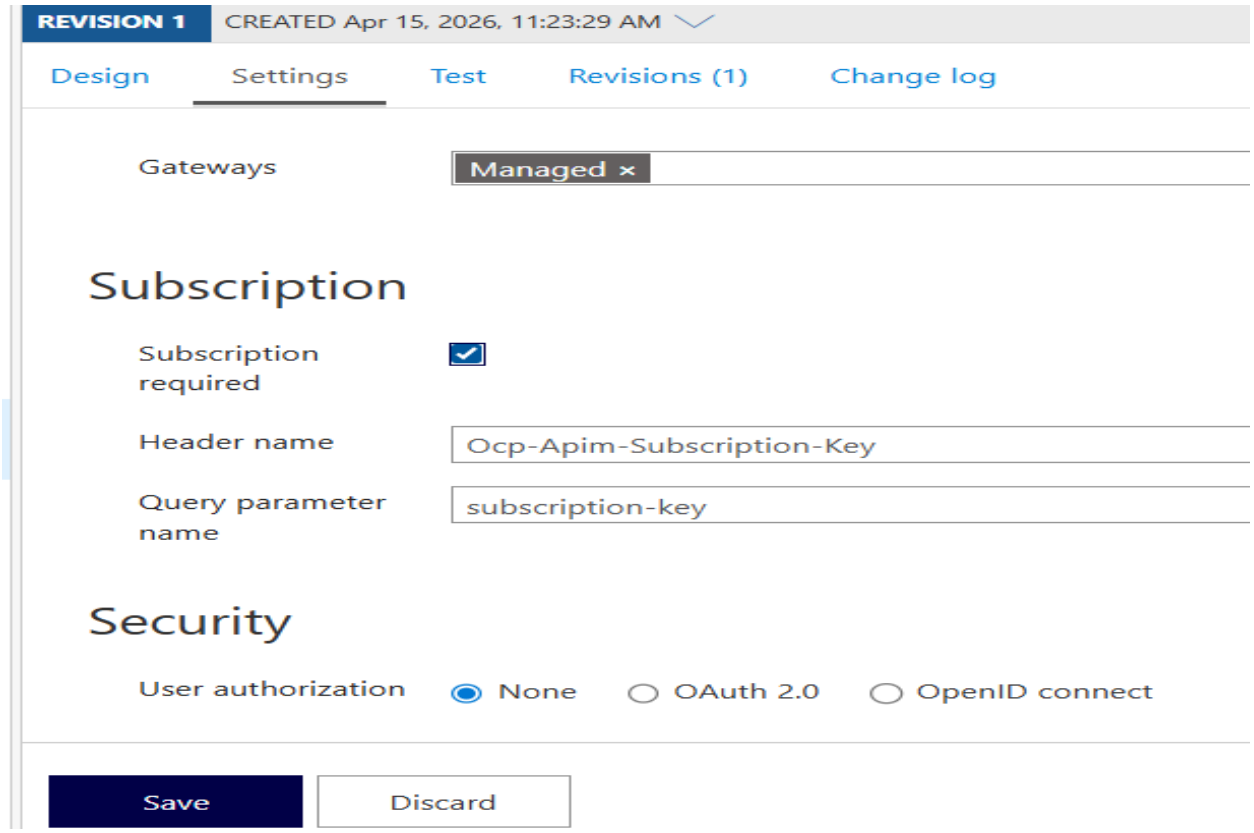
Step 3: Open API Management Service in Azure Portal

Open APIM service and verify that the published API has been added.



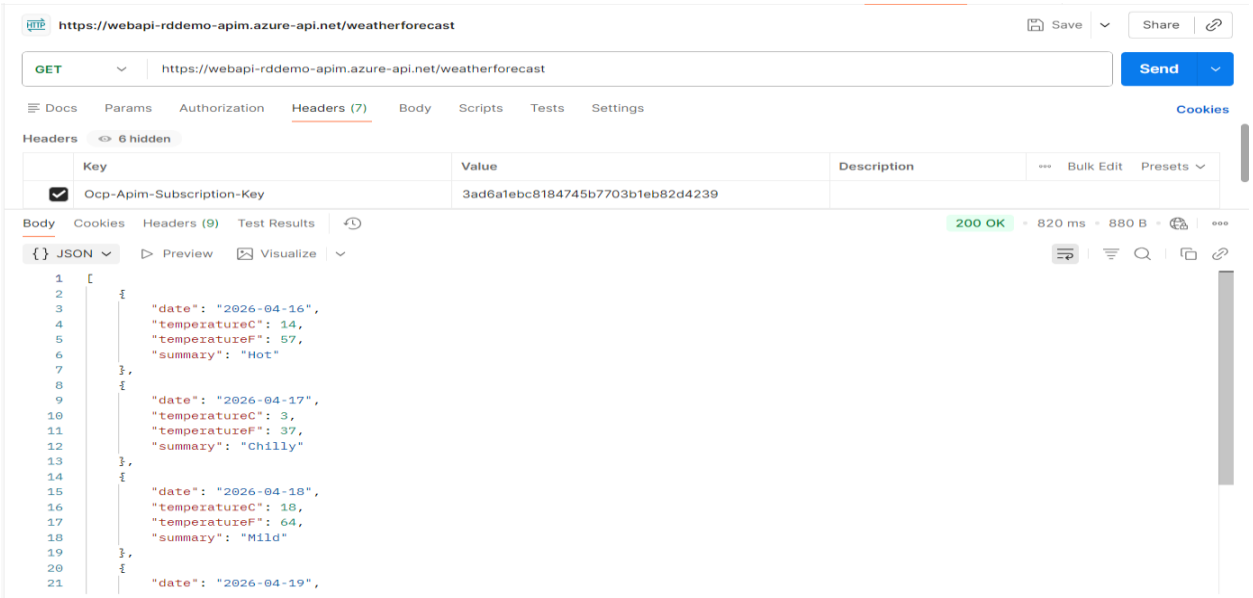
Step 4: Configure Subscription Required = Enabled

In API Settings, enable subscription key requirement.



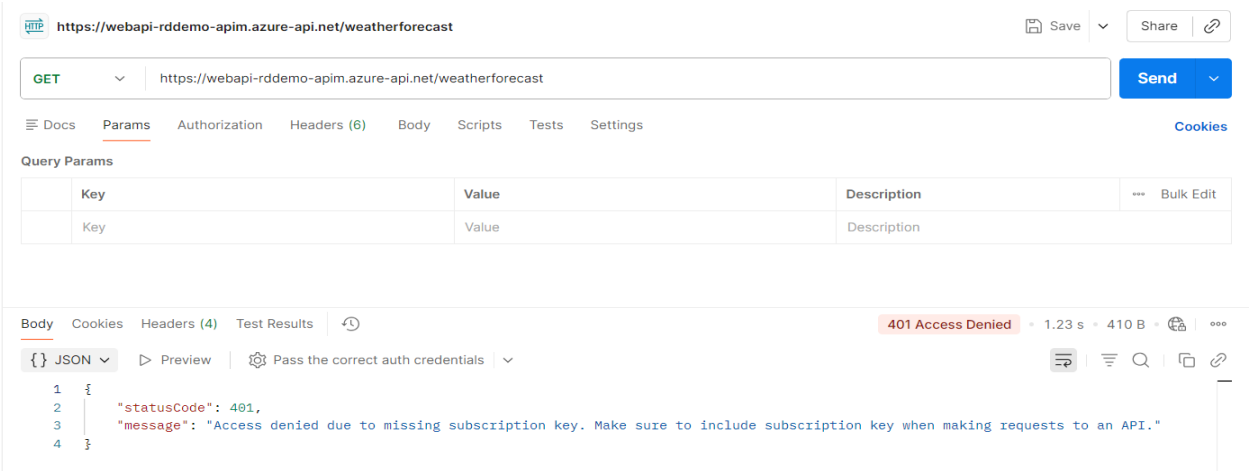
Step 5: Test API with Subscription Key (Success)

Call the endpoint with Ocp-Apim-Subscription-Key header. Response returns HTTP 200 OK.



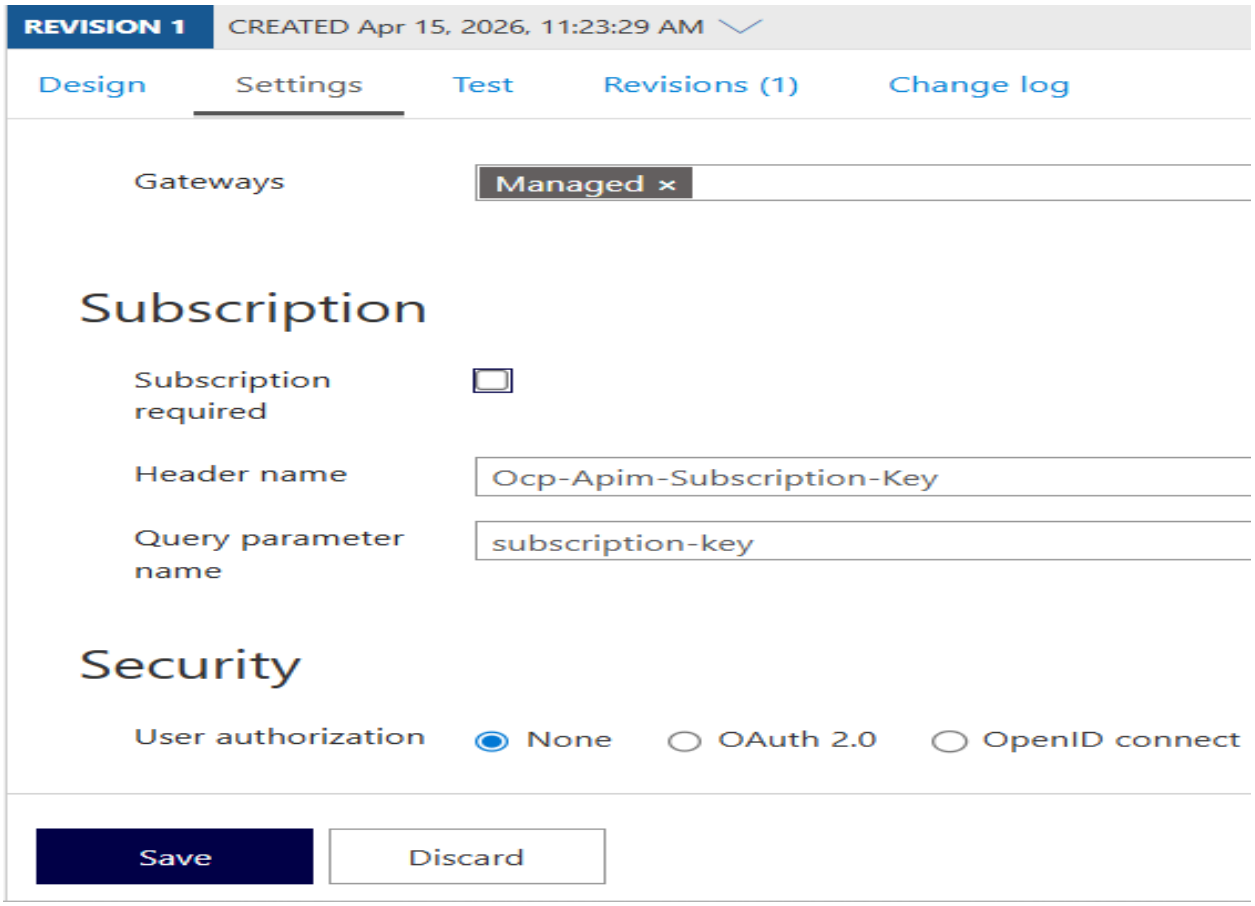
Step 6: Test API without Subscription Key (Access Denied)

When subscription is required and key is missing, APIM returns HTTP 401 Access Denied.



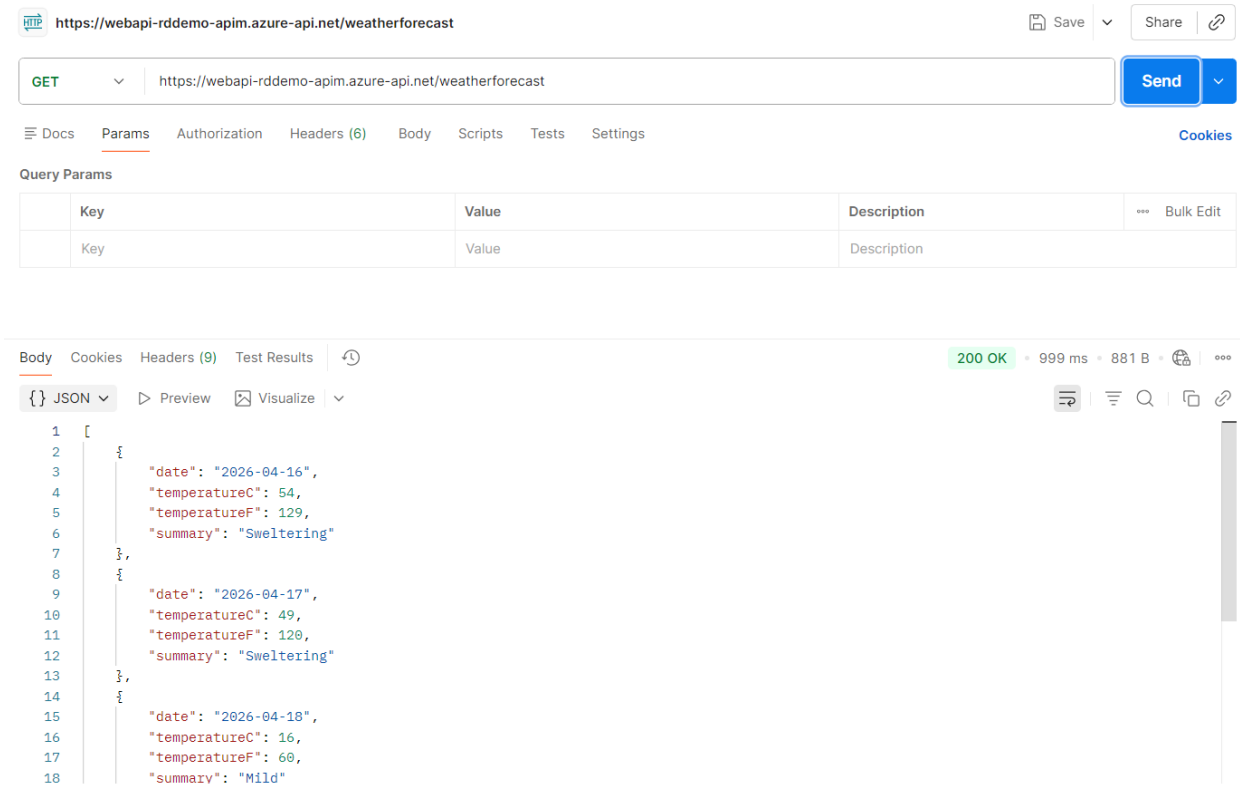
Step 7: Configure Subscription Required = Disabled

Disable subscription requirement in APIM settings and save changes.



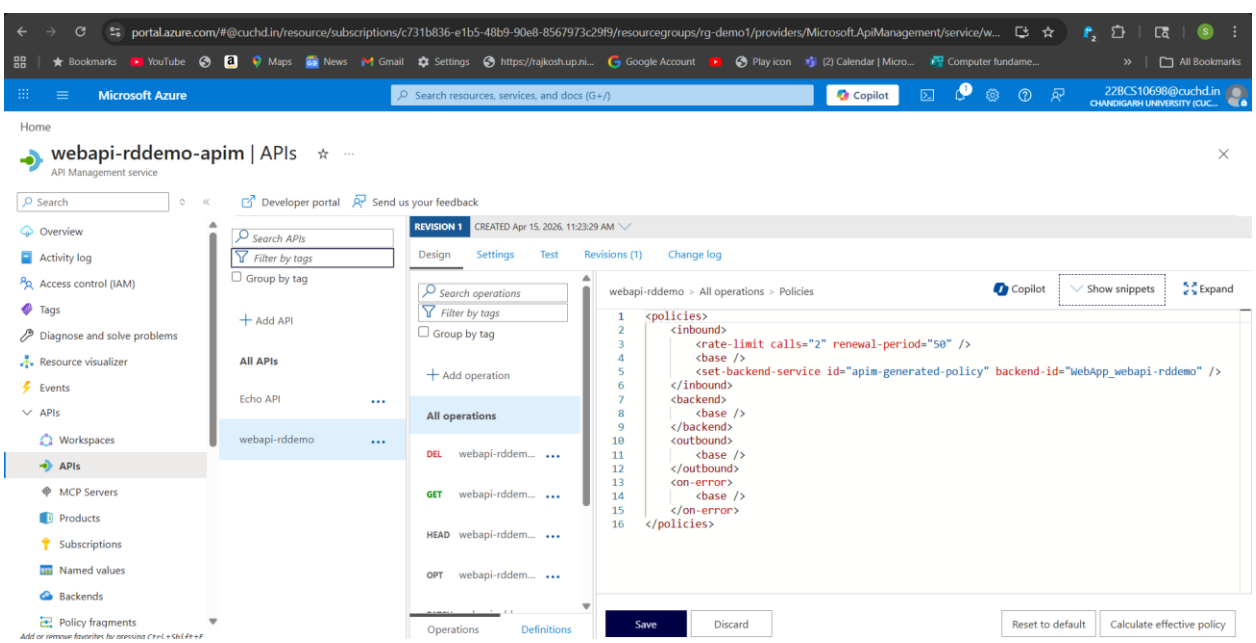
Step 8: Test API without Subscription Key (Success)

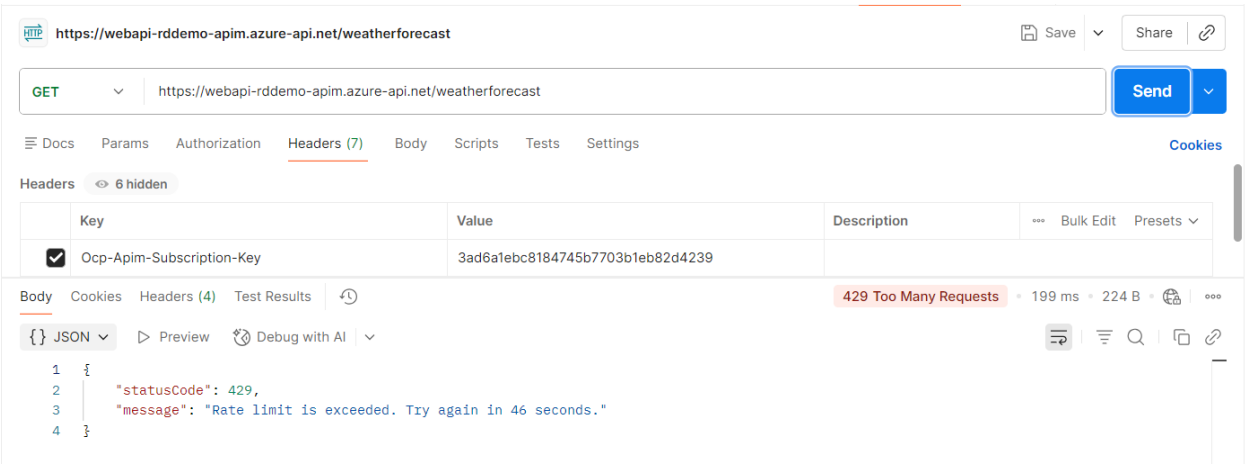
Call the endpoint with Ocp-Apim-Subscription-Key header. Response returns HTTP 200 OK.



Step 9: Apply Rate Limit Policy in APIM

Apply inbound policy to restrict number of calls in a renewal period.



Step 10: Verify Rate Limit Exceeded Response


After exceeding allowed requests, APIM returns HTTP 429 Too Many Requests.
